AiNspire

TM AI PERSONA ASSESSMENT PLATFORM

DOCUMENT 2 OF 2 · HACKATHON PLAYBOOK

Improvement Plan & Work Demarcation

A prioritised upgrade path from the current v1 baseline to a defensible hackathon entry — with every workstream assigned to Shahril, Tien or Ain, sequenced across a three-sprint plan, and anchored to a demo script that cannot fail on stage.

Division
Open / Advanced — custom code permitted

Track
AI for Workforce Productivity

Baseline
v1 React + Express (commit 27ebc07)

Shahril Nizam
Architecture, backend, go-to-market

Tien
UI/UX, AI design tooling, front end

Ain
Business case, content, governance

— How to Use This Plan

THE PLAN IN SIX SENTENCES

AiNspire already works, but most of what a judge sees is demonstration data rather than real data. Our goal is to make the parts we show on stage genuinely real — results that get saved, an HR dashboard built from actual submissions, a login, and learning recommendations that name real TM courses. **Shahril** builds the things that must be true (data, security, APIs). **Tien** builds the things people see (screens, the demo build). **Ain** builds the things people must believe (course catalogue, ROI, governance, the pitch). The work is split so none of us is ever waiting on the other two. If we run out of time, there are three items that matter more than everything else — they are named on the last page.

How the document is organised

Section	What it gives you	Read it when
1–2	Honest assessment of where we are, and one sentence describing where we want to be	Before you start, so we all agree on the goal
3	Every improvement, numbered, with an owner and a time estimate	When you want the full picture or need to trade something off
4	**Your personal instructions.** Find your name, read only your pages	Every day. This is the working section
5	What depends on what, and the three-sprint schedule	When planning your week
6–8	Demo script, risks, and the final checklist	In the last sprint

Three rules we agree to up front

1. **One owner per item.** If your name is not on it, do not edit it — raise it with the owner instead. This avoids merge conflicts and avoids two people solving the same thing differently.
2. **Agree the shape before building.** If Tien needs a new piece of data on a screen, Shahril writes down what it will be called and what it looks like *first*. Tien then builds against a dummy version and swaps in the real one later. Nobody sits idle.
3. **Honesty beats polish.** A screen labelled "illustrative" scores better than a screen caught pretending. Where we cannot make something real in time, we label it.

Words used in this plan

Term	What it means here
P0 / P1 / P2	Priority. **P0** = must ship, the entry is weak without it. **P1** = this is what we win on. **P2** = only if there is spare time.

Term	What it means here
Persist / persistence	Saving data so it survives a page refresh. We currently save nothing.
API / endpoint	A request the browser can make to our server. Each one does a single job.
API contract / shape	A written agreement on exactly what data an endpoint sends back, agreed before anyone builds against it.
Hardcoded / mock	Typed into the code by hand. Looks like data, isn't data.
Fallback	The backup behaviour when the AI fails. Ours counts the quiz answers instead.
Rotate a key	Cancel the old password for TM's AI service and issue a new one.
Purge from history	Delete something from every past version of the code, not just the current one. Deleting a line today does not remove it from yesterday's saved versions.
Effort "1.5 d"	One and a half working days of focused effort for that one person.

1 Where We Stand

v1 is further along than most hackathon entries ever get. It is deployed, trilingual, visually strong, and its core AI reasoning is genuinely real. The risk is not that we have too little — it is that the **proportion of the demo that is real is much smaller than it appears**, and a sharp judge will find that in under two minutes.

What is genuinely strong

- Live TM-hosted LLM classification — not a wrapper around a public API
- Holistic reasoning that can override the plurality vote; free text is weighted highest
- Full trilingual output regenerated by the model per language
- Persona stability guard so language switching cannot change the result
- Honest rule-based fallback with a visible degraded-state badge
- Working client-side PDF and CSV export
- Deployed and reachable: GitHub Pages plus Render
- A second live AI endpoint producing structured 90-day plans

What will be attacked

- **Nothing is stored.** Refresh the page and the assessment is gone
- **No login.** Anyone with the URL opens the HR dashboard
- 12 of 13 "employees" in the HR view are hardcoded
- All ten divisions and every learning statistic are invented
- "Live Workforce Intelligence" badge over a screen with zero API calls
- "Approve & Route to Training" sets a boolean and routes nothing
- A live TM API key is committed to a public repository
- Recommendations are free text, not real bookable TM courses

> **THE STRATEGIC READ**
>
> We do not need more features. We need to **convert the existing demo surface into something real**, and we need a business case strong enough that the judges remember the commercial story rather than the UI. Our unfair advantage is that one of us sells this for a living and one of us can generate production-grade UI faster than most teams can wireframe. The plan below leans on both.

2 Target State for the Hackathon

One sentence to steer every decision:

> **OUR TARGET**
>
> **An authenticated employee completes an AI assessment, the result is permanently stored against their identity, their HR manager sees a dashboard built entirely from real submitted assessments, approves the AI recommendation, and that approval is recorded as an auditable decision that assigns a real, named TM learning pathway.**
>
> If we achieve only that and ship nothing else, we have a far stronger entry than today — because every number on screen becomes defensible.

2.1 Target architecture

3 Prioritised Improvement Backlog

Nineteen items across three priority bands. P0 items are non-negotiable; the entry is materially weaker without each one. Effort is in person-days for the named owner.

HOW TO READ THESE TABLES

This section is the full reference list. **If you just want to know what to do, skip to Section 4 and find your name** — the same work is written there as plain step-by-step instructions. Come back here when you need the reasoning behind an item or want to trade something off against time.

P0 — Must ship. These remove our biggest attack surfaces.

#	Improvement	Owner	Effort	Why it matters and what "done" looks like
1	**Rotate and purge the leaked TM API key**	SHAHRIL	0.5 d	Revoke the key with the TM GPU proxy owners, remove the hardcoded default so the server fails loudly without an env var, purge it from git history, and add a secret scan to CI. This is a security incident on a public repo — it is done first, before any feature work.
2	**Make assessments persist**	SHAHRIL	1.5 d	Define the Drizzle schema that `lib/db` has been waiting for — `assessments`, `approvals`, `course_catalogue` — and write a row on every successful classification. The `persistent-db` mockup already specifies the exact columns. Done = refresh the browser and your result is still there.
3	**Drive the HR dashboard from real data**	SHAHRIL	1 d	Add `GET /api/team/:division` returning real aggregates, and replace `DEMO_TEAM` with it. Keep a clearly labelled "seed demo cohort" toggle so the dashboard still looks populated on stage. Done = the person who takes the quiz during the demo appears in the HR table seconds later.

#	Improvement	Owner	Effort	Why it matters and what "done" looks like
4	**Add identity**	SHAHRIL	1.5 d	Gate the app behind a login and gate the HR dashboard behind an HR role. Full TM SSO if the hackathon environment allows it; otherwise an email magic link or a signed demo token — the point is that results attach to a person and HR data is not public. The `sso-login` mockup is the design.
5	**Make the approval real**	SHAHRIL	0.5 d	"Approve & Route to Training Programme" writes an approval record with approver, timestamp, assessment reference and the assigned pathway, and the UI reads that record back. This turns our governance claim from a slide into a feature — and governance is exactly what a telco judging panel rewards.
6	**Fix every false claim in the UI**	TIEN	0.5 d	Change "Live Workforce Intelligence" to "Illustrative Workforce Model" wherever the data is simulated; remove "drag status to advance" or implement the drag; either make "Send Reminder" send something or relabel it. One honest label costs us nothing and removes a whole line of hostile questioning.
7	**Harden the two AI endpoints**	SHAHRIL	0.5 d	CORS allow-list, rate limiting per IP and per user, a 30-second `AbortSignal` with one retry on the LLM call, input validation on `/action-plan`, and stop returning raw error strings to the client. Protects both TM's GPU budget and our live demo.

P1 — High value. These are what we actually win on.

#	Improvement	Owner	Effort	Why it matters and what "done" looks like
8	**Real TM course catalogue, mapped to personas**	AIN + SHAHRIL	1.5 d	Today the model invents course titles. Build a catalogue of real named courses — TM Academy, LinkedIn Learning, Coursera — each tagged with persona, level, duration and provider, then constrain the model to **select from that catalogue** rather than invent. Ain sources and curates the content; Shahril wires the retrieval into the prompt. This converts "nice AI output" into "a bookable learning pathway", which is the single biggest credibility jump available to us.
9	**Replace derived dimension scores with real sub-scores**	SHAHRIL	0.5 d	The four report dimensions are currently arithmetic offsets from one confidence number. Ask the model to return four scores with one-line justifications each. Same visual, genuinely different substance — and it survives the question "how did you calculate that?"
10	**Manager-facing "why this person" panel**	TIEN	1 d	Let an HR manager click any employee row and see that person's reasoning, confidence, sub-scores and recommended pathway, with an approve/override action inline. This is the moment the product stops being a quiz and starts being a workforce tool.
11	**Validate LLM output with the Zod schemas we already generate**	SHAHRIL	0.5 d	`lib/api-zod` exists, is generated from the OpenAPI spec, and is almost entirely unused. Refresh the spec to include `/action-plan` and `lang`, regenerate, and validate both LLM responses. If validation fails, retry once with a stricter instruction before falling back. Eliminates the "the model returned something weird and the UI broke" failure mode on stage.

#	Improvement	Owner	Effort	Why it matters and what "done" looks like
12	**Honest AI progress on the thinking screen**	TIEN	0.5 d	Stream or stage the real request so Observe / Reason / Decide / Produce reflect actual progress instead of a fixed 7.6-second timer. If streaming is too costly, drive the steps from real request milestones. Judges notice fake progress bars.
13	**Division selector wired end to end**	TIEN	0.5 d	The action-plan request hardcodes "IT Strategy & Orchestration". Add a real division picker that flows into both the dashboard query and the plan request, so the 90-day plan is demonstrably about the division on screen.
14	**Business case and ROI model**	AIN	2 d	A defensible model: assessment cost per employee versus a consultant-led capability audit, time-to-pathway reduction, the value of a trilingual instrument in TM's actual workforce mix, and a three-year rollout curve across TM's divisions. Judges score impact, and impact needs numbers we can defend — not a readiness index we invented.
15	**Responsible-AI and PDPA position**	AIN	1 d	Written positions on data retention, employee consent, the right to contest a classification, bias testing across language and grade, and why a human must approve before any pathway is assigned. For a telco with real HR data obligations, this is a scoring category — and right now our only artefact is a sentence in a UI panel.

P2 — If time allows. Good differentiators, not load-bearing.

#	Improvement	Owner	Effort	Description
16	Re-assessment and progress over time	SHAHRIL	1 d	Store a quarterly cycle per assessment so an employee can retake and see movement — Explorer in Q1 to Builder in Q3. Turns a snapshot into a trajectory and makes the whole platform recurring rather than one-shot.
17	Server-side PDF generation	TIEN	1 d	Move report rendering server-side so PDFs are consistent, emailable and archivable, using the `pdf-report` mockup's light print theme rather than a screenshot of a dark UI.
18	Mobile-first assessment flow	TIEN	1 d	Most TM employees will take this on a phone. The assessment flow should be verified and tuned for small screens; the HR dashboard can stay desktop-only.
19	Repository hygiene	SHAHRIL	0.5 d	Remove the unused `api-client-react`, the duplicate `html2canvas`, the unused `wouter`, Replit build artefacts, the stale `gitsafe-backup` remote and the `pnpm-lock 2.yaml`. If judges read the repo, it should look deliberate.

4 Work Demarcation

The split follows capability rather than convenience: Shahril owns everything that must be *true*, Tien owns everything that must be *seen*, Ain owns everything that must be *believed*. Each person has a clean boundary so we are not waiting on each other.

THIS IS THE WORKING SECTION

Find your name. Each person gets: why the split landed that way, a table of workstreams, a **numbered list of what to do in what order**, and one hard boundary — the thing you should deliberately *not* touch, so three people never collide in the same file.

Shahril Nizam — Architecture, Backend & Commercial Lead

Owns the system of record, the AI pipeline, security, and the client-facing commercial story

Why this split

You are the only one of the three who is both hands-on in this codebase and accountable for how it is sold. Every item that determines whether the demo is *real* sits with you, because those are the items a technical judge will probe and a client will ask about in a follow-up meeting.

Workstreams

Workstream	Items	Deliverable
Security remediation	1, 7	Key rotated and purged from history, secret scanning in CI, CORS allow-list, rate limiting, LLM timeout and retry, validated inputs, sanitised error responses.
Persistence layer	2, 16	Drizzle schema for `assessments`, `approvals`, `course_catalogue`; migrations; writes on every classification; quarterly cycle field.
Real data APIs	3, 5, 13	`GET /api/team/:division`, `POST /api/approve`, division parameterisation of the action plan.
Identity	4	Login, session handling, HR role gate on the dashboard route and the team API.
AI pipeline quality	9, 11	Refreshed OpenAPI spec, regenerated Zod schemas wired into both routes, retry-on-invalid, four real sub-scores from the model.
Catalogue retrieval	8 (with Ain)	Takes Ain's curated catalogue and constrains the model to select from it rather than invent course titles.
Commercial narrative	—	How this is sold through TM One, TM Global, Unifi, MMU and VADS BPO: who buys it, what it displaces, what it costs. You are the only person in the room who can answer the "would anyone actually pay for this" question.
Integration owner	—	Final merge, deployment, and the go/no-go call on what ships.

Do these in this order

1. **Kill the leaked key.** Have the current key cancelled and a new one issued by whoever administers the TM GPU proxy. Put the new one *only* in the Render dashboard and your local `.env` file. Change the code so that if the key is missing the server refuses to start, instead of falling back to a value written into the code. Then purge the old key from the repository's history and switch on GitHub secret scanning.
2. **Write down the API contracts and send them to Tien.** Before building anything, write out — in a message, not a document — exactly what `GET /api/team/:division` and `POST /api/approve` will return, field by field. Tien starts building against that immediately. This single step is what stops him being blocked for two days.
3. **Harden the two AI endpoints.** Restrict which websites may call our server, cap how often anyone can call it, add a 30-second limit with one automatic retry on the AI call, check incoming data on `/action-plan` before using it, and stop sending raw error text back to the browser. Half a day, and it protects both TM's AI budget and our live demo.
4. **Build the database.** Define three tables — assessments, approvals, course catalogue. The `persistent-db` mockup already shows the exact columns; use it. Then write a row every time a classification succeeds.
   Done when: you complete an assessment, refresh the browser, and your result is still there.
5. **Build the team endpoint and retire the fake team.** Have the HR dashboard read real rows instead of the twelve invented employees. Keep a clearly labelled "demo cohort" toggle so the dashboard still looks full on stage.
   Done when: someone takes the assessment and appears in the HR table seconds later.
6. **Add login.** Full TM SSO if the environment allows it; otherwise an email link or a signed demo token. The requirement is that a result belongs to a named person and that the HR dashboard is not public — not specifically SSO.
7. **Make approval real.** When HR clicks "Approve & Route to Training", save who approved it, when, for which assessment, and which pathway was assigned — then show that record back on screen.
8. **Wire in Ain's course catalogue.** Instead of letting the AI invent course names, give it her list and instruct it to choose from that list only.
9. **Tighten the AI output.** Update the API specification, regenerate the validation schemas that already exist in `lib/api-zod`, and check the AI's reply against them. If the reply is malformed, ask once more with stricter wording before falling back.
10. **Ask the AI for four real sub-scores** rather than calculating them from one number.

> **YOUR HARD BOUNDARY**
>
> Do not touch component styling or layout. Tien is faster at it than you are, and every hour you spend on CSS is an hour the persistence layer is not getting. If a screen needs a new field, define the API shape and hand it over.

Tien — Experience, Interface & Demo Surface Lead

Owns everything the judges and clients actually look at

Why this split

You have the AI design tooling, which means you can produce and iterate production-quality UI far faster than the rest of us. That is a genuine competitive edge in a time-boxed hackathon — so you should be building screens continuously, not blocked waiting for backend work. Every item assigned to you can be built against a mocked API contract and wired up later.

Workstreams

Workstream	Items	Deliverable
Honesty pass on the UI	6	Every misleading label corrected across all three languages. Smallest task, highest protective value — do it first.
Employee detail drawer	10	Click an employee row, see their reasoning, confidence, sub-scores and pathway, approve or override inline. The signature new screen of this release.
Authentic AI progress	12	Thinking screen driven by real request milestones rather than a fixed timer.
Division selector	13	Picker in the HR header that flows through to the dashboard query and the action-plan request.
Report and PDF quality	17	Adopt the `pdf-report` mockup's light print theme, showing real named courses with provider, duration and level.
Mobile assessment flow	18	Assessment verified and tuned on phone-sized viewports.
Mockup integration	—	Promote `sso-login`, `persistent-db` and `hr-portal` from the sandbox into the real app as Shahril's APIs land. The designs already exist — this is integration, not invention.
Demo rehearsal build	—	A pinned, tested build for the presentation, plus a verified offline fallback path.

Do these in this order

1. **Fix every false label first.** Two hours of work, biggest protective value of anything on your list.
   - "✦ Live Workforce Intelligence" → **"Illustrative Workforce Model"** on the statistics screen.
   - Delete "drag status to advance candidates" — there is no drag-and-drop.
   - "Send Reminder" → either make it do something or rename it so it does not claim to send anything.
   - Do all three in **English, Bahasa Melayu and Chinese** — the text lives in one dictionary file, so it is three edits each, not a rewrite.
2. **Add the division selector.** A dropdown in the HR header that genuinely changes which division the dashboard and the 90-day plan are about. Right now the plan always says "IT Strategy & Orchestration" no matter what is on screen.
3. **Build the employee detail drawer — your headline piece.** An HR manager clicks any row and a panel slides in showing that person's AI reasoning, confidence, sub-scores and recommended pathway, with Approve and Override buttons right there.
   Start it with a hardcoded example file so you are not waiting for Shahril. Swap in the real data when his endpoint lands.
   Done when: the demo can go from "here is the team" to "here is why the AI said this about this person" in one click.
4. **Make the AI thinking screen honest.** Today Observe → Reason → Decide → Produce is a fixed 7.6-second animation that runs whether or not the AI is doing anything. Drive those four steps from real milestones in the request instead. Judges notice fake progress bars.
5. **Promote the SSO screen** from the `mockup-sandbox` folder into the real app once Shahril's login is ready. The design already exists — this is wiring, not designing.

6. **Upgrade the report PDF.** Use the light print theme from the `pdf-report` mockup and show real named courses with provider, duration and level — instead of a dark screenshot with free-text suggestions.
7. **Check the assessment on a phone.** Most TM employees will take this on mobile. The HR dashboard can stay desktop-only; the six questions and the result cannot.
8. **Build and rehearse the demo build.** In the final sprint, produce one pinned build, run the full demo against it end to end, and confirm the result badge says **"AI classified"** in cyan — not the yellow fallback badge. Then freeze it.

> **YOUR HARD BOUNDARY**
>
> Do not change prompt wording, API contracts or the persona definitions. The classification behaviour is the one thing in this product that is genuinely ours, and it should change in exactly one place with one owner. If a screen needs new data, ask Shahril for the field — do not derive it in the component. That is how we ended up with four dimension scores computed from one number.

Ain — Business Case, Content & Governance Lead

Owns why this matters, what it is worth, and why TM is allowed to run it

Why this split

Hackathons are rarely lost on engineering — they are lost on the answer to "so what?". Your workstreams are fully independent of the codebase, need no engineering access, and map directly onto the scoring categories that technical teams habitually neglect. Items 8, 14 and 15 are, between them, probably worth more marks than any three features on the backlog.

Workstreams

Workstream	Items	Deliverable
TM learning catalogue	8	A curated spreadsheet of real courses — TM Academy first, then LinkedIn Learning and Coursera — each tagged with persona fit, level, duration, provider and whether it is TM-exclusive. Hand to Shahril as structured data. **This is the highest-leverage task any of us has.**
Business case & ROI	14	Cost per assessment versus consultant-led capability audits, time-to-pathway reduction, trilingual coverage value, and a three-year rollout curve across TM divisions.
Responsible AI & PDPA	15	Retention policy, consent model, right to contest a classification, bias-testing approach across language and grade, and the human-approval rationale.
Realistic baseline data	—	Replace the invented division figures with plausible, sourced, clearly-labelled illustrative figures — and own the wording that makes the illustrative nature explicit.
Persona content review	—	Review the BM and CN translations and the persona descriptions for tone and cultural fit. We currently have three languages validated by nobody.
Pitch narrative	—	Own the deck and the opening two minutes. Shahril closes on commercials; you set up the problem.

Workstream	Items	Deliverable
Judge Q&A preparation	—	Write the hostile-question list and our agreed answers — starting with "how much of this is real?" We answer that question on our terms, in the first ninety seconds.

Do these in this order

1. **Build the TM course catalogue — start today, this is the most valuable task any of us has.** A simple spreadsheet. One row per course, with these columns:
   - Course name · Provider (TM Academy / LinkedIn Learning / Coursera) · Which persona it suits (Explorer / Builder / Strategist / Visionary) · Level (Beginner / Intermediate / Advanced) · Duration · TM Exclusive? (yes/no) · Link if there is one

   Aim for 20 rows by the end of Sprint 1, even if incomplete. Twenty real courses beat a hundred planned ones. Prioritise TM Academy first — "TM employees can book this on Monday" is a far stronger claim than a Coursera link anyone could find.
   Why it matters: right now the AI invents course names. With your list, it recommends real, bookable training. That is the single biggest credibility jump available to us.

2. **Build the ROI model.** A spreadsheet plus one page of explanation answering four questions:
   - What does it cost today to assess AI capability across a division? (Consultant-led audits — get a real figure or a defensible estimate.)
   - What does AiNspire cost per employee assessed?
   - How much faster does someone get from "assessed" to "enrolled in training"?
   - What would a three-year rollout across TM divisions look like, in people and ringgit?

   Every number must have a source or a stated assumption. Judges score impact, and impact needs numbers we can defend under questioning.

3. **Write the Responsible-AI and PDPA position.** Two pages covering: how long we keep assessment data and why; how employees consent; how an employee contests a classification they disagree with; how we would test for bias across language and job grade; and why a human must approve before any training pathway is assigned. For a telco handling real HR data this is a scoring category — and our only artefact today is one sentence in a UI panel.

4. **Replace the invented division figures.** The statistics screen currently claims GNT has 2,100 assessed employees and similar for nine other divisions. Give us plausible, sourced, clearly-labelled illustrative figures instead — and you own the wording that makes the illustrative nature obvious.

5. **Review the Bahasa Melayu and Chinese content.** We ship in three languages and nobody has checked the tone or the cultural fit of the persona descriptions. Read them as an employee would.

6. **Write the hostile-question list.** Every uncomfortable question a judge could ask, with our agreed answer. Start with **"how much of this is actually real?"** — Section 8 of Document 1 is the honest answer; your job is to turn it into a confident 20-second reply.

7. **Own the deck and the opening two minutes.** You set up the problem; Shahril closes on the commercials. Rehearse the opening until it needs no notes.

> **YOUR HARD BOUNDARY**
>
> Deliver content as structured data — spreadsheets, tables, written positions — not as code changes or edits to component files. If a figure needs to appear on screen, hand it to Tien in a defined shape. One person editing the codebase per layer, always.

5 Dependencies and Sequencing

Three dependencies determine the critical path. Everything else can run in parallel.

Blocked work	Waits for	How we avoid stalling
Tien — employee detail drawer (10)	Shahril — team API (3)	Shahril publishes the JSON shape on day 1. Tien builds against a local fixture and swaps the fetch in later.
Shahril — catalogue retrieval (8)	Ain — curated catalogue	Ain delivers twenty rows by end of day 2 even if incomplete. Twenty real courses beat a hundred planned ones.
Shahril — real HR dashboard (3)	Shahril — persistence (2)	Strictly sequential and both his. This is the longest single chain, so persistence starts immediately after the key rotation.

Three-sprint plan

Sprint	Shahril	Tien	Ain
Sprint 1 `Make it safe`	Rotate and purge the key (1). Harden both endpoints (7). Define and ship the DB schema (2). **Publish all API contracts.**	UI honesty pass across all three languages (6). Division selector (13). Begin the detail drawer against fixtures (10).	Start the course catalogue (8). Draft the ROI model skeleton (14).
Sprint 2 `Make it real`	Team API (3). Identity and role gate (4). Real approval records (5). Zod validation wired in (11).	Finish the detail drawer and wire to the live API (10). Authentic AI progress (12). Promote the SSO screen from the sandbox.	Deliver the catalogue to Shahril. Complete the ROI model (14). Draft the Responsible-AI position (15).
Sprint 3 `Make it land`	Catalogue-constrained recommendations (8). Real sub-scores (9). Repo hygiene (19). Deploy and freeze.	Report and PDF upgrade (17). Mobile pass (18). Build and rehearse the pinned demo build.	Finalise the deck and the hostile-question list. Review BM and CN content. Rehearse the opening.

> **THE ONE RULE THAT PROTECTS THE SCHEDULE**
>
> **Nothing merges into `main` in the final sprint without a rehearsed demo run against the deployed build.** Our highest-probability failure is not a missing feature — it is a last-minute merge that breaks the deployed frontend's `VITE_API_URL` and silently drops us into the rule-based fallback on stage, in front of the judges, with no AI reasoning visible.

6 Demo Script

Seven minutes, four beats. Shahril drives the laptop; Ain opens and handles governance questions; Tien stands by for anything that breaks.

Min	Lead	Beat	What we say and show
0–1	AIN	The problem	TM is investing in AI across every line of business and has no instrument to tell it *who in the workforce is actually ready*. Capability audits are consultant-led, expensive, English-only and out of date the moment they are delivered.
1–3	SHAHRIL	Live assessment	Invite a judge to take the quiz. Six questions. Show the TM-hosted model's reasoning citing their own words. **Switch to Bahasa Melayu live** — the narrative regenerates, the persona does not change. Say that out loud: it is a deliberate guarantee, not a coincidence.
3–5	SHAHRIL	HR view	Open the dashboard. **The judge who just took the assessment is in the table.** Open their detail drawer, show the reasoning, approve the pathway, show the approval recorded with approver and timestamp. Then generate the 90-day plan live for their division.
5–6	AIN	Governance	No classification reaches an official system without human approval. Here is the retention policy, the consent model, and the employee's right to contest. Name the illustrative figures as illustrative before anyone asks.
6–7	SHAHRIL	Commercials	GITD builds it; TM One, TM Global, Unifi, MMU and VADS BPO sell it. Here is the cost per assessment against a consultant audit, and here is the three-year rollout. Close on what we need to take it to a real client pilot.

> **SAY THIS IN THE FIRST NINETY SECONDS**
>
> "The classification, the reasoning, the recommendations and the 90-day plan are all live against TM's own hosted model. The division-level figures on the statistics screen are an illustrative model, and they are labelled as such." Disclosing it ourselves converts our biggest weakness into evidence of rigour. If a judge finds it first, it reads as a misrepresentation.

7 Risk Register

Risk	Likelihood	Impact	Owner	Mitigation
TM LLM endpoint unavailable or slow during the demo	Medium	Critical	SHAHRIL	Timeout plus retry; pre-warm the endpoint minutes before; keep a pre-recorded screen capture of a successful live run as an absolute last resort.
`VITE_API_URL` wrong in the deployed build, silently forcing the fallback	Medium	Critical	TIEN	Pin and rehearse the demo build; add a visible build-time banner if the API base URL is unset.
Judge asks "how much of this is real?"	High	High	AIN	Pre-empt it in the opening ninety seconds. Reality Register in Document 1 is our prepared answer.
Leaked key discovered by a judge reviewing the public repo	Medium	Critical	SHAHRIL	Rotate and purge in Sprint 1. Non-negotiable, first task.

Risk	Likelihood	Impact	Owner	Mitigation
SSO unavailable in the hackathon environment	Medium	Medium	SHAHRIL	Magic link or signed demo token as the fallback. The requirement is attributable identity, not specifically SSO.
Persistence slips and the HR dashboard stays mocked	Low	High	SHAHRIL	Longest dependency chain, so it starts first. If it slips, relabel the dashboard as a simulation and lead with the employee journey instead.
Scope creep from the P2 list	High	Medium	SHAHRIL	P2 is explicitly optional. Nothing from P2 starts until every P0 item is merged and demonstrated.

8 Definition of Done

Tick these off. If every box is ticked, we have shipped what we set out to ship.

Shahril

- ☐ Key rotated, purged, scanning in CI
- ☐ Assessments survive a refresh
- ☐ HR dashboard reads real rows
- ☐ Login gates the HR view
- ☐ Approvals are recorded and read back
- ☐ Both endpoints validated and throttled
- ☐ Recommendations come from the catalogue
- ☐ Commercial model written down

Tien

- ☐ No false claim left in any language
- ☐ Employee detail drawer shipped
- ☐ Approve/override works inline
- ☐ AI progress reflects the real request
- ☐ Division selector flows end to end
- ☐ Report PDF uses the print theme
- ☐ Assessment verified on mobile
- ☐ Demo build pinned and rehearsed

Ain

- ☐ Course catalogue delivered as data
- ☐ ROI model defensible with sources
- ☐ Responsible-AI position written
- ☐ PDPA and retention position written
- ☐ Illustrative figures labelled and owned
- ☐ BM and CN content reviewed
- ☐ Deck complete, opening rehearsed
- ☐ Hostile-question answers agreed

IF WE ONLY DO THREE THINGS

1. Rotate the key. **2.** Make assessments persist so the HR dashboard is real. **3.** Replace invented course titles with Ain's real TM catalogue.

Those three convert AiNspire from an impressive prototype into a product we can put in front of a TM One or VADS client the following week — which, given what we actually do for a living, is the real prize here.
